

# Computer Simulations in Physics

PHYS 409: Computational Methods in Physics

## Three Ways of Doing Physics

Theory

$$\nabla \cdot \mathbf{D} = \rho_v$$

$$\nabla \cdot \mathbf{B} = 0$$

$$\nabla \times \mathbf{E} = -\frac{\partial \mathbf{B}}{\partial t}$$

$$\nabla \times \mathbf{H} = \frac{\partial \mathbf{D}}{\partial t} + \mathbf{J}$$

Experiment

Simulation

# Moore's Law (Transistor Count)

Moore's Law – The number of transistors on integrated circuit chips (1971-2016)

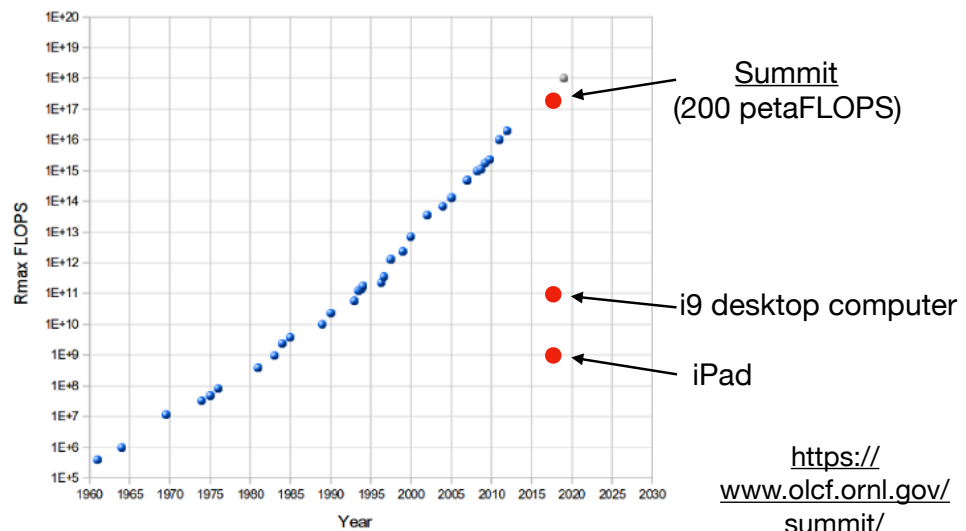

Moore's law describes the empirical regularity that the number of transistors on integrated circuits doubles approximately every two years. This advancement is important as other aspects of technological progress – such as processing speed or the price of electronic products – are strongly linked to Moore's law.

Data source: Wikipedia ([https://en.wikipedia.org/wiki/Transistor\\_count](https://en.wikipedia.org/wiki/Transistor_count))  
The data visualization is available at [OurWorldinData.org](https://OurWorldinData.org). There you find more visualizations and research on this topic. Licensed under CC-BY-SA by the author Max Roser.

# Moore's Law (FLOPS)

Number of Floating Point Operations (FLOPS) performed by the fastest supercomputer doubles every 1-2 years.

## Why Simulations?

- Sometimes it is not possible to perform experiments (astrophysics, geophysics)
- Sometimes the theory is too complex to obtain analytic solutions (nonlinear problems with many degrees of freedom)
- Simulations can be cost effective (running 10 simulations might be cheaper than building 10 experiments)

# How Trustworthy are Simulations?

A JPL study estimated that the number of computer “bugs” in a program decreases exponentially with time spent debugging.

This means you can never be sure your code is completely free of bugs 😞.

**Always test your code!! Verification is Essential!!**

- Run code for problems with known solutions.
- Test subcomponents of the code on a wide range of simple problems to make sure they behave appropriately.
- Monitor conserved quantities to make sure they stay conserved.
- Try to think up as many “reality checks” as you possibly can.

## Computational Tools

**Symbolic Calculations:**

- Maple
- Mathematica

**General Purpose Interpretive languages:**

- Matlab - engineering, science, economics (nice integrated interface, but expensive)
- Python - open source, object-oriented (growing in popularity)

**Low-Level compiled languages:**

- C - custom applications (fluid flow, plasmas, EM,...)
- Fortran - mostly
